**Abstract:** The proposed work aims to provide a path planning solution that use data about sea and weather conditions to find the optimal path the links 2 positions.

**Keywords:** path planning; sea-state

## 1. Introduction

In recent years, robotics has been optimizing the monitoring and exploration of maritime and coastal scenarios through the use of multiple and sophisticated autonomous systems. This category includes the Autonomous Underwater Vehicles (AUV), underwater robots capable of completing missions autonomously, and the Autonomous Surface Vehicles (ASV), vehicles that rotate on the surface of the water without a crew. The application fields are various: geological prospecting, oceanographic monitoring, military sector, etc. Maritime navigation is an essential aspect of the shipping industry. Path planning in a maritime scenario is the process of determining the optimal route a vessel can take from the point of departure to the destination.

The goal of this paper is to propose a new path planning method that uses a probability map to influence the final path according to sea-weather conditions. The algorithm has been tested on a real scenario, where the path planning has been performed in a maritime environment in the "Gulf of Naples" (Italy) according to the "Progetto ARES - Autonomous Robotics for the Extended Ship". Our contribution to the project is the development part of a DSS (Decision Support System) that helps the operator during a mission by providing a path planning solution that takes into account sea-weather conditions. The focus will be on discussing the various challenges that arise in this area and the proposed solutions to overcome them. The method will be compared to some state-of-the-art techniques too.

### 1.2. WiP

The Leader Algorithm is a probabilistic and continuous path planning algorithm. A discrete and deterministic version has been created for those applications where the probability map does not have a high resolution and for which the execution speed is fundamental. The algorithm continues to be online.

Similarly to the case of particles, we speak here of *leader cell*. All the basic mechanisms previously described remain valid: the leader cell is the one with the highest value in the entire workspace; at each iteration of the algorithm only the leader cell is diffused; the new

cell is stored only if the new value is higher than the old one; the stopping criterion occurs when the leader cell and the start cell correspond.

A  $3 \times 3$  kernel centered on the leader cell is used for the diffusion process. All actions have a priority of 1. Furthermore, the outcome of a given action is certain. In any case, the current implementation does not prohibit being able to condition these two characteristics.

A cell is updated as follows:

$$v_i = v(\mathcal{L}_i) + \log p(s, a) + R(s)$$

where  $v_i$  is the value of the new cell  $i$ ,  $v(\mathcal{L}_i)$  is the value of the leader cell,  $\log p(s, a)$  is the value associated to the state-action pair (in particular, greater weight is given to steps taken diagonally) and  $R(s)$  is the reward associated with the state  $s$ . Notice how, unlike the continuous version, the transition takes place in log-space.

TODO

## 2. Method

In our work, we consider a discrete environment of size  $N \times M$  and the considered agent can move in eight directions: up, down, left, right, and the four diagonal directions. Using a discrete representation of the environment, each cell of the grid, that represent the possible states of the agent, can be associated with a variable  $r_{i,j}$  (Reward), where  $i$  and  $j$  are the row and column indices of the cell, respectively. The value of  $r_{i,j}$  is 1 if the cell is occupied and 0 if the cell is completely free of obstacles or a value between 0 and 1 wherever there is an higher or lower preference to move in that cell. The agent can move from one cell to another only if the destination cell is free.

The reward function  $r_{i,j}$  is a function of the current state of the environment, and it is assumed to be known to the agent. This function has been obtained by modeling the input dataset and it will be discussed in the next section.

### 2.1. Input data

The developed module takes as input several sets of data divided into:

- Data for the construction of the parameterized map: wave motion
- Mission data: mission objectives, NG Worker start and goal positions, drone release positions (Intermediate positions), mission duration, etc.;

All the weather data are provided by the PARTHENOPE. The data are provided in the form of a netCDF file, which is a self-describing file format that allows the storage of multidimensional arrays of scientific data and they are used to store both the map and the reward function. As input data for the construction of the reward function, the following parameters are considered:

- Significant height of wind and swell waves (see figure 1a).
- Peak direction (see figure 1b).
- Coastal map (see figure 2a).

The significant height of the waves information has been used to get the informations about the Sea State. The term Sea State describes the general condition of the surface of the open sea. This is comprised of two core measurements, the wave height which is dependent on the local surface wind strength and thus termed the 'wind sea' and the swell which is a slow and regular movement of the sea in rolling waves that do not break and are in the process of dissipating as they travel from their relatively distant origin.

The sea state is described by the following chart:

Code	Height [m]	Description
0	no wave	Calm (Glassy)
1	0 - 0.10	Calm (Rippled)
2	0.10 - 0.50	Smooth (Wavelets)
3	0.50 - 1.25	Slight
4	1.25 - 2.50	Moderate
5	2.50 - 4.00	Rough
6	4.00 - 6.00	Very Rough
7	6.00 - 9.00	High
8	9.00 - 14.00	Very High
9	14.00+	Phenomenal

Those informations are transformed in a probabilistic fashion using values from 0 to 1, where 0 means sea state 0 and 1 sea state greater or equal to 4.

Sea state greater then 4 are considered as the same because the considered agent (NG Worker) is not able to operate in those conditions.

The coast map is a binary map where 1 represents the presence of a coast and 0 the absence of a coast. This map has been processed applying a Gaussian filter to the original map to create a smooth transition between the coast and the sea to create different zones to avoiding collisions of the results path with the coast as shown in figure 2b.

(a) Wave height

(b) Peak direction

(a) Coast map

(b) Coast map smoothed

The reward function is obtained by combining the three parameters in a weighted sum and then normalizing the result in the range  $[0,1]$ .

### 2.3. Communication

The communication between all the components of the DSS can communicate through a MQTT broker. MQTT or Message Queue Telemetry Transport is a featherlight and effective message protocol developed for the Internet of effects( IoT). It allows bias to change data in a publish- subscribe model, where data is published by a sender and entered by one or further subscribers. The protocol is grounded on a customer- garçon armature where guests can publish or subscribe to motifs on a garçon( also known as a broker). MQTT is ideal for IoT bias because it consumes minimum bandwidth and has low above, making it able for low- authority and resource- constrained bias. Its simplicity, scalability, and trustability have made it popular with inventors and has come a standard-issue protocol in the IoT assiduity. An MQTT broker is a intermediary mecca that acts as a communication broker between MQTT guests. It's responsible for entering, storing, and ranking dispatches between guests. When an MQTT customer publishes a communication to a special content, the broker receives the communication and forwards it to all acceded guests that are interested in that content. also, when an MQTT customer subscribes to a content, the broker stores the subscription and forwards any dispatches published on that content to the acceded customer.

On the other phase, an MQTT customer is a device or operation that communicates with an MQTT broker. It can be either a publisher, subscriber, or both. When a customer publishes a communication to a special content, it sends the communication to the broker, which also on it to all acceded guests. When a customer subscribes to a content, it sends a subscription request to the broker, which stores the subscription and forwards any dispatches published on that content to the acceded customer.

In summary, the MQTT broker acts as an conciliator between MQTT guests, entering and ranking dispatches, while the MQTT guests are the bias or operations that give with the broker, publishing and assenting to dispatches. Together, the MQTT broker and guests form a publish- subscribe network, allowing effective and dependable message in IoT surroundings.

## 5. Results

This section may be divided by subheadings. It should provide a concise and precise description of the experimental results, their interpretation as well as the experimental conclusions that can be drawn.

### 5.1. Subsection

#### 5.1.1. Subsubsection

Bulleted lists look like this:

- First bullet;
- Second bullet;
- Third bullet.

Numbered lists can be added as follows:

1. First item;
2. Second item;
3. Third item.

The text continues here.

5.2. Figures, Tables and Schemes

All figures and tables should be cited in the main text as Figure 3, Table 1, etc.

**Figure 3.** This is a figure. Schemes follow the same formatting. If there are multiple panels, they should be listed as: **(a)** Description of what is contained in the first panel. **(b)** Description of what is contained in the second panel. Figures should be placed in the main text near to the first time they are cited. A caption on a single line should be centered.

**Table 1.** This is a table caption. Tables should be placed in the main text near to the first time they are cited.

Title 1	Title 2	Title 3
Entry 1	Data	Data
Entry 2	Data	Data <sup>1</sup>

<sup>1</sup> Tables may have a footer.

The text continues here (Figure 4 and Table 2).

**Figure 4.** This is a wide figure.

**Table 2.** This is a wide table.

Title 1	Title 2	Title 3	Title 4
Entry 1 *	Data	Data	Data

5.3. *Formatting of Mathematical Components*

This is the example 1 of equation:

149

150

$$a = 1,$$

(1)

the text following an equation need not be a new paragraph. Please punctuate equations as regular text.

This is the example 2 of equation:

151

152

153

$$a = b + c + d + e + f + g + h + i + j + k + l + m + n + o + p + q + r + s + t + u + v + w + x + y + z \quad (2)$$

## 6. Discussion 154

Authors should discuss the results and how they can be interpreted from the perspective of previous studies and of the working hypotheses. The findings and their implications should be discussed in the broadest context possible. Future research directions may also be highlighted. 155  
156  
157  
158

## 7. Conclusions 159

This section is not mandatory, but can be added to the manuscript if the discussion is unusually long or complex. 160  
161

## 8. Patents 162

This section is not mandatory, but may be added if there are patents resulting from the work reported in this manuscript. 163

186

**Informed Consent Statement:** Any research article describing a study involving humans should contain this statement. Please add “Informed consent was obtained from all subjects involved in the study.” OR “Patient consent was waived due to REASON (please provide a detailed justification).” OR “Not applicable” for studies not involving humans. You might also choose to exclude this statement if the study did not involve humans. 187  
188  
189  
190  
191

Written informed consent for publication must be obtained from participating patients who can be identified (including by the patients themselves). Please state “Written informed consent has been obtained from the patient(s) to publish this paper” if applicable. 192  
193  
194

**Data Availability Statement:** We encourage all authors of articles published in MDPI journals to share their research data. In this section, please provide details regarding where data supporting reported results can be found, including links to publicly archived datasets analyzed or generated during the study. Where no new data were created, or where data is unavailable due to privacy or ethical re-strictions, a statement is still required. Suggested Data Availability Statements are available in section “MDPI Research Data Policies” at <https://www.mdpi.com/ethics>. 195  
196

**Acknowledgments:** In this section you can acknowledge any support given which is not covered by the author contribution or funding sections. This may include administrative and technical support, or donations in kind (e.g., materials used for experiments).

**Conflicts of Interest:** Declare conflicts of interest or state “The authors declare no conflict of interest.” Authors must identify and declare any personal circumstances or interest that may be perceived as inappropriately influencing the representation or interpretation of reported research results. Any role of the funders in the design of the study; in the collection, analyses or interpretation of data; in the writing of the manuscript; or in the decision to publish the results must be declared in this section. If there is no role, please state “The funders had no role in the design of the study; in the collection, analyses, or interpretation of data; in the writing of the manuscript; or in the decision to publish the results”.

**Sample Availability:** Samples of the compounds ... are available from the authors.

## Abbreviations

The following abbreviations are used in this manuscript:

MDPI    Multidisciplinary Digital Publishing Institute  
DOAJ    Directory of open access journals  
TLA    Three letter acronym  
LD    Linear dichroism

## 9.

All appendix sections must be cited in the main text. In the appendices, Figures, Tables, etc. should be labeled, starting with “A”—e.g., Figure A1, Figure A2, etc.
